

An aerial photograph of Lagos, Nigeria, showing a dense urban landscape with numerous buildings and a prominent skyline in the background. The sky is hazy with soft, warm light from the setting or rising sun, creating a golden glow over the city. The water of the Lagos Lagoon is visible in the distance.

HOW MIGHT WE EXPAND AFFORDABLE HOUSING IN LAGOS

Group 7

INTRODUCTION

The unaffordable housing crisis in Lagos has created severe socio-economic and structural consequences, with many residents spending 50–70% of their income on rent, resulting in a "vicious cycle" of poverty, reduced productivity, and economic stagnation.

REASONS WHY IT MATTERS

WHY?

- How might we reduce homelessness in Lagos
- How might we improve productive living for residents
- How might we reduce insecurity
- How might we improve standard of living
- How might we improve communal living

BEST POSSIBLE SOLUTIONS TO THE PROBLEM

HOW?

- How might we implement rent control
- How might we introduce Installment payments and housing loans
- How might we implement land reform policies
- How might we improve public-private partnerships
- How might we regulate agents exploitation

KEYFACTS TABLE

METHODS OF OBSERVATION

INTERVIEWS

- **RESIDENTS OF MAKOKO AREA**

The interview revealed that many people living in the river-side slum area of Makoko face serious housing challenges. Due to poverty, several families are forced to live in overcrowded conditions, with about 10–12 people sharing a single small room made from wooden planks and they still pay rent of about ₦10,000 per month. Many cannot afford higher rents, such as ₦500,000 per year, which forces them to remain in these slum communities.

- **HOMELESS PEOPLE**

The interview highlighted that the lack of affordable housing contributes to homelessness and can lead to social problems such as theft, kidnapping, cultism, and begging. The people expressed a strong desire for affordable housing in better environments with electricity, security, and improved living conditions. Additionally, people living in the slum areas are more vulnerable to illnesses such as malaria and fever due to poor sanitation and living conditions.

- **A REAL ESTATE DEVELOPER-** Engr.

Daramola

The interview with a real estate developer highlighted several challenges in providing affordable housing in Lagos. According to the developer, one of the biggest barriers is the high cost of land. The location of a property in Lagos greatly determines the price of the land, making it difficult to develop low-cost housing. The developer also explained that construction requires professional services such as surveyors, and building equipments.

- **A CONSTRUCTION SITE AGENT- Mr Akeem**

The interview with another developer, revealed that essential building materials such as cement, granite, blocks, and sand are very expensive but the most expensive is reinforcement. A large portion of the total construction cost is spent on purchasing land and building materials.

However, the developer suggested that constructing multi-storey buildings could help reduce housing costs. By building upward instead of spreading out, developers can use less land, which may lower the overall cost of development and eventually make rent more affordable for people

METHODS OF OBSERVATION

SHADOWING

Using shadowing as an observation method, we followed and interacted with residents in the slum to understand their daily lives. Many explained that difficult life situations forced them to live there, and some stay because it is close to their workplaces in areas like Lekki. They pay small rents of about ~~₦~~5,000–~~₦~~10,000 per month for simple plank houses built on water, which is still difficult for them to afford.

SHADOWING

Residents also said the government once asked them to leave but did not provide alternative housing. Although the environment is dirty, unhealthy, and unsuitable for raising children, many people have adapted to it over time. Despite these harsh conditions, the community showed resilience and hoped that sharing their stories could lead to better housing opportunities in the future.

METHODS OF OBSERVATION

FLY ON THE WALL

We observed a man in the slum area gathering plastic bottles inside the dirty water, as his daily business work. This is one of the jobs they do in order to afford housing and shelter.

METHODS OF OBSERVATION

UNOBSTRUSIVE MEASURES-Physical traces

During our observation, the environment was extremely dirty and lacked basic facilities such as toilets, so residents improvised by using planks to create private spaces. The houses were mainly built with wood and metal sheets, and some were even constructed over polluted water, which shows that the residents do not have enough financial support or resources to build stronger and safer homes. We also noticed clothes hanging outside and household items scattered around, indicating that families live in small and overcrowded spaces. These conditions highlight serious sanitation and health concerns. Overall, our observations reveal the urgent need for affordable housing so that families can live in cleaner, safer, and more dignified environments.

METHODS OF DOCUMENTATION

THE FIVE HUMAN FACTOR

- COGNITIVE

The residents told us that even though the environment is not good and there is dirty water around, they have learned to live with it because they have no other choice. Some of them said they now feel used to the place, even though it is not safe or healthy.

METHODS OF DOCUMENTATION

THE FIVE HUMAN FACTOR

- CULTURAL

One interesting thing we observe was that despite the poor housing conditions, the community still had a strong social life. The residents shared common norms, habits, values, and lifestyles. They supported each other, interacted closely, and maintained a sense of unity within the community.

.

METHODS OF DOCUMENTATION

THE FIVE HUMAN FACTOR

- EMOTIONAL

During our conversation with the residents, their emotional state seemed mixed. Many of them appeared calm and accepting of their situation because they had already adapted to the environment. Some expressed resignation, explaining that they had no choice but to live there after being asked to leave their previous homes. Although the living conditions were difficult, they tried to remain hopeful and focused on supporting one another as a community.

METHODS OF DOCUMENTATION

THE FIVE HUMAN FACTOR

- PHYSICAL

During our field visit, we went to a community where many people are currently facing serious housing problems. When we arrived, we noticed that the environment was very uncomfortable to live in. The area was surrounded by dirty and stagnant water, and the ground was muddy and unclean. The houses there were small, weakly built, and some looked temporary, as if they were put together quickly just to provide shelter.

METHODS OF DOCUMENTATION

AEIOU FRAMEWORK

- ACTIVITIES

During the field visit, the residents were mainly engaged in their daily survival activities within the slum community. They have built small shelters for themselves after being asked by the government to leave their former homes. Despite the poor conditions, they continue to live, work, and carry out their daily routines in the area. Some residents explained that they stay there because it is closer to their workplaces, making it easier for them to go to work and return home each day.

METHODS OF DOCUMENTATION

THE FIVE HUMAN FACTOR

- SOCIAL

Even though the living conditions were difficult, many of them have become accustomed to their community and feel comfortable with the people, shared values, and lifestyle around them.

METHODS OF DOCUMENTATION

AEIOU FRAMEWORK

- ENVIRONMENT

The environment of the community was very uncomfortable and not suitable for healthy living. The area was surrounded by dirty and stagnant water, and the ground was muddy and unclean. Many of the houses were small and weakly constructed, appearing temporary and fragile. The structures looked like they were quickly put together using simple materials just to provide shelter for the residents.

METHODS OF DOCUMENTATION

AEIOU FRAMEWORK

- INTERACTIONS

Despite the difficult living conditions, the residents interacted closely with one another and appeared to have strong social connections. The community members supported each other and shared a sense of togetherness. When we spoke with them, they were open to discussing their experiences and how they ended up living in the area. Their interactions showed that they had developed a cooperative and supportive community lifestyle.

METHODS OF DOCUMENTATION

AEIOU FRAMEWORK

- OBJECTS

The main objects observed in the community were the small makeshift houses built with simple materials such as planks and other temporary building resources. The area also contained stagnant water around the houses, muddy pathways, and basic household items used by the residents for daily living. These objects showed the limited resources available to the people living there.

METHODS OF DOCUMENTATION

AEIOU FRAMEWORK

- USERS

The users in this environment were the residents of the community who had previously lived in other areas but were forced to relocate after being asked to leave their homes by the government. Many of them have adapted to the difficult conditions because they have no alternative housing options. Even though the environment is unhealthy, they have become accustomed to living there and have built a supportive community with shared values and lifestyles.

INSIGHTS

- **Low-Income Residents Cannot Afford Formal Housing**

From the interview in Makoko, many residents cannot afford high rents (such as ₦500,000 annually). As a result, they settle for cheaper wooden houses in slum areas.

- **High Cost of Land is a Major Barrier**

Since land takes a large portion of construction costs, it becomes difficult for developers to build houses that low-income earners can afford.

INSIGHTS

- **Overcrowding is Common in Slum Communities**

Due to limited affordable housing, many families live in small rooms with 10–12 people sharing a space. This indicates a severe housing shortage for low-income populations.

- **Expensive Building Materials Increase Housing Costs**

Materials such as cement, granite, blocks, and sand are costly. These high material costs make it harder for developers to construct affordable housing for the poor.

INSIGHTS

- **Demolition of Slums Without Alternatives Worsens Housing Problems**

Government demolition of houses in slum areas may increase homelessness if there are no affordable housing alternatives provided for displaced residents.

- **Vertical Housing Could Be a Possible Solution**

The building of multi-storey buildings can reduce the amount of land needed. This may lower development costs and make rent more affordable for residents.

INSIGHTS

- **Poor Living Conditions Affect Health and Safety**

Residents in slum areas often live in wooden houses near water and are more vulnerable to illnesses like malaria and fever. Poor housing conditions also increase the risk of insecurity and social problems.

- **Strong Demand for Affordable and Better Living Conditions**

Residents expressed a desire to live in safer environments with electricity, security, and better infrastructure, showing a strong demand for affordable but decent housing.

DEFINE POINT OF VIEW

User Journey Map: Residents Living in a Slum Community

Goal: To survive daily, maintain employment, and find a place to live despite limited housing options.

User Persona

- Displaced from former home and living in a temporary slum settlement

PAIN POINTS

- Lack of affordable housing
- Demolished shelters by government
- Forced to relocate to overcrowded rooms
- Live around floating slums
- Exposed to several health hazards
- Navigate through murky waters daily
- No alternatives for better housing

CONCEPT MAPPING

Problem Tree Analysis

Affinity Clustering

1. Some houses built over water
2. Reduces transport cost
3. Small houses
4. Poor sanitation facilities
5. Unhealthy environment
6. Low income levels
7. Crowded living conditions
8. Saves commuting time
9. Lack of government support
10. Cheap rent but still hard to pay
11. Limited building materials
12. Dirty surroundings
13. Limited building materials
14. Limited land availability in central areas
15. Household items scattered
16. Unsafe living conditions
17. Limited personal space
18. Unsafe housing structures
19. Polluted water around houses
20. Poor waste disposal
21. Unhealthy environment
22. Difficulty in affording conducive house
23. Easy access to jobs
24. Few economic opportunities
25. Need for safer homes
26. Houses made of wood and metal sheets
27. No proper toilets
28. Need for affordable housing options

Housing Conditions

- Houses made of wood and metal sheets
- Some houses built over water
- Weak and temporary structures
- Limited building materials
- Unsafe housing structures

Sanitation and Environment

- Dirty surroundings
- No proper toilets
- Polluted water around houses
- Poor waste disposal
- Unhealthy environment

Economic Challenges

- Low income levels
- Difficulty in affording conducive house
- Limited financial support
- Cheap rent but still hard to pay
- Few economic opportunities

Location and Work

- Close to workplaces
- Reduces transport cost
- Easy access to jobs
- Saves commuting time

Living Space

- Small houses
- Crowded living conditions
- Clothes hung outside
- Household items scattered
- Limited personal space

Need for Better Housing

- Unsafe living conditions
- Poor sanitation facilities
- Lack of government support
- Need for safer homes
- Need for affordable housing options

IDEATE PHASE

BRAINSTORMING

ALTERNATIVE WORLDS

- Public Library: example just like Brooklyn public library , it shows how something can be shared instead of owned. Libraries let people use books and media for free without having to buy them. In the same way, we can imagine a large Community Land Trust. Like a library keeps books for everyone to use, the trust would keep land and buildings for the community. People could live in the homes by paying lower, affordable rents, and the homes would always stay affordable instead of being sold on the regular housing market

- The Food Bank: Food banks collect extra or unused food and give it to people who need it. In the same way, we could create “housing banks.” These would find empty homes or unused rooms and connect them with families who need a place to live.
- Farmers markets: connect local sellers and buyers in one place to make food accessible. A "housing market" would connect small landlords with empty places to families needing affordable homes using a website or program. This expands housing by filling empty apartments faster and making rentals easier to find.

CONCEPT METAPHOR AND ANALOGY

Direct Analogy

- **Metaphor: Beehive Structure**

Affordable housing is compared to a beehive, where many bees live in organized compartments within one structure. Instead of each bee building a separate nest, they share a large structure that contains many small spaces.

Similarly, vertical housing buildings can function like a beehive, where many families live in individual apartments within one building. This allows more people to live comfortably in a limited space while sharing resources and infrastructure.

Fantasy Analogy

- **Metaphor: Expanding buildings**

Imagine buildings in Lagos that can grow taller automatically whenever more people need homes, like magical towers that expand upward without taking more land. Whenever the population increases, new floors appear instantly, creating more apartments for families. The building adapts to the city's needs without requiring more land.

Symbolic Analogy

- **Metaphor: A tree with many branches**

Affordable housing can be symbolized as a large tree. The trunk represents the housing structure, while the branches represent many housing units that support different families. Just as a tree supports many leaves and branches from one root system, a vertical house can support many households from one foundation.

Personal Analogy

- **Metaphor: Living Inside the Building**

Imagine being a resident in a well-designed multi-storey housing building in Lagos. You live on the 6th floor, your neighbors live on different floors, and hundreds of families share the same land but in different levels. Y

ou use shared facilities like elevators, water supply, and security. Even though the land space is small, the building allows many people to live comfortably in one area.

GROUPING AND CATEGORIZING

Most Rational

- Affordable Renovation of old building to generate new ones at affordable prices
- Regulating the middlemen extortion in housing projects
- Providing loans to facilitate easy payment
- Government housing projects at affordable prices
- Utilising locally sources building materials like bamboo
- Created a non-profit funding for housing, to get donation from people towards housing projects

Most Exciting

- Subsidizing the prices of building materials
- Providing softwares that links developers to affordable caravan houses
- Providing more jobs for people to reduce unemployment
- Facilitating installmental payment or easy-payment scheme

Long shot

- Issue out all private vacant houses to homeless people at affordable prices
- Production of building materials in Lagos to facilitate easy and cheaper building projects.
- Building of vertical storey buildings with massive units to accommodate several people and manage cost of land.

SCAMPER

Using the SCAMPER method, we generate ideas by asking questions under Substitute, Combine, Adapt, Modify, Put to other uses, Eliminate, and Rearrange.

Substitute

- Substitute expensive building materials with cheaper locally sourced materials, like compressed earth blocks, or bamboo.
- Use modular construction instead of traditional building methods. These are houses built in factories in sections and later assembled on site.

Combine

- Combine residential buildings with small business spaces so residents can work where they live.
- Combine housing projects with public transportation hubs to reduce commuting costs.
- Combine government housing programs with private real estate

Adapt

- Adapt cooperative housing systems where groups of people collectively finance and manage housing projects.
- Adapt co-living models where some facilities (kitchen, laundry, workspace) are shared.
- Adapt micro-mortgage financing used in developing countries for low-income earners.

Modify

- Modify buildings to allow vertical expansion (multi-story affordable housing).
- Modify house designs to include smaller but functional apartment units such as studio apartments for single residents.
- Modify construction processes to use prefabricated parts for faster building.

Put to other uses

- Convert unused government land or abandoned underutilized government buildings into affordable housing.
- Turn empty office spaces into residential units.
- Use shipping containers as low-cost housing structures.
- Use vacant land for urban farming or community gardens, with housing integrated into the design

Eliminate

- Reduce land costs by using public land or land-leasing models
- Reduce the number of intermediaries in land acquisition and construction processes.
- Eliminate unnecessary luxury features in affordable housing projects.
- Eliminate complex building approval processes to speed up development.

Rearrange

- Reverse the traditional housing model by allowing residents to pay gradually before full construction is completed.
- Rearrange housing layouts to prioritize community living spaces and shared facilities.
- Reverse the developer-led model by encouraging community-driven housing cooperatives
- Rearrange payment structures for affordable housing (e.g., rent-to-own schemes)

TWO BY TWO MATRIX

Technically Feasible	LOW	1. Provision of installmental payment plan 2. Building more storeys or vertical houses with massive units	1. Provision of government housing for homeless people 2. Provision of shelter by religious centers	
	HIGH	1. A software that links developers with potential residents 2. Eradicating the middlemen extortion in housing prices	1. Issuing out all private vacant houses to the homeless people 2. Renovate Abandoned houses and encourage smaller house designs	
		HIGH	LOW	Financially Viable

How might we expand affordable housing in Lagos

Proposed Solution

- **The construction of vertical or multi-storey residential buildings with large housing capacity.**

This approach focuses on building upwards instead of outwards so that more housing units can be created on a limited piece of land.

A good example of this model is the well-known 1004 Estate in Lagos, which contains several high-rise residential blocks that accommodate many households within the same land area.

Description

One of the major challenges affecting affordable housing in Lagos is the high cost and scarcity of land. Because Lagos is densely populated and rapidly urbanizing, land prices in many parts of the city are extremely high. When developers build single houses or low-density housing, the cost of the land is shared by only a few households, which increases the final price of each home.

The proposed solution is to develop vertical housing projects, such as multi-storey or high-rise apartment buildings, that contain a large number of residential units within one development. Instead of building only a few houses on a plot of land, developers can construct buildings with multiple floors containing hundreds of apartments. E.g A housing development can include 10–15 storey apartment blocks with 80–120 apartments and multiple blocks.

Expected benefit of the solution

- **Efficient Use of Land**

Vertical housing allows developers to build many housing units on a small land area. This is particularly important in Lagos where land is scarce and expensive.

- **Lower Housing Costs per Unit**

When many apartments are built within one structure, the cost of land, infrastructure, and construction is shared across multiple units, reducing the final price or rent for each resident.

- **Increased Housing Supply**

Large multi-storey developments can accommodate thousands of people within a single estate. Increasing the housing supply helps reduce the housing deficit in Lagos

Proposed Solution

- **Facilitating Housing Loans and Easy-Pay Schemes (Installment Payment)**

Many people in Lagos cannot afford to pay for the full cost of a house upfront. Even when relatively affordable housing units exist, the initial payment required to purchase a home is often too high for low- and middle-income earners.

Because of this, many residents continue to rent or live in informal settlements. To address this, developers and financial institutions can introduce flexible housing loan systems and installment payment plans that allow buyers to pay gradually over time.

Description

Through partnerships with mortgage banks, microfinance institutions, and government housing programs, individuals can access low-interest housing loans with longer repayment periods. Instead of paying the full cost at once, buyers can make monthly or quarterly payments, similar to rent, until the property is fully paid for.

This system makes home ownership accessible to more people, especially salary earners and small business owners who have stable income but limited savings. Easy-pay schemes can also include rent to own programs, where tenants gradually acquire ownership of the property through regular payments.

Expected benefit of the solution

- **Reduces the financial burden of homeownership**

Instead of paying millions of naira upfront, buyers can spread the cost of the house over many years, making it more affordable.

- **Improved living standards**

Home ownership provides stability, security, and better living conditions for families.

- **Increases access to housing for low-middle income earners**

Many people who earn regular monthly income but lack large savings can still qualify for housing through structured repayment plans

Proposed Solution

- Establish a foundation for donations towards affordable housing

The creation of a non-profit housing foundation that collects donations and financial support specifically for the development of affordable homes.

This foundation would act as an organized platform where individuals, companies, philanthropists, and international organizations can contribute funds toward housing projects for low-middle income families. The donations collected would be used to finance the construction of affordable housing units, support housing subsidies, or assist families who cannot afford housing on their own.

UNITY HOUSING FOUNDATION: AFFORDABLE HOUSING ECOSYSTEM

Description

The foundation could operate in partnership with housing developers, government agencies, and financial institutions to ensure that the funds are properly managed and directed toward real housing projects. It may also collaborate with housing programs supported by organizations such as the Federal Mortgage Bank of Nigeria or other housing initiatives that aim to improve access to affordable homes.

The foundation will pool financial contributions from different donors and use the funds to support the construction or subsidization of affordable houses for people who need it.

Expected benefit of the solution

- Increased funding for affordable housing development.
- Lower housing costs for low-income families.
- Community involvement, as people from different backgrounds can contribute.
- Faster expansion of affordable housing projects.
- Improved living conditions for people who cannot afford expensive housing.
- Reduced financial burden on government
- Reduces the cost of housing projects

It's now time to begin the
PROTOTYPE phase!

PROTOTYPE PHASE

PROTOTYPE - PHYSICAL

The physical prototype of our design consists of a high-rise residential building with multiple floors, each containing several apartments. The building is designed to include different types of units such as studio apartments, one-bedroom apartments, and two-bedroom apartments to cater to individuals, couples, and small families. Overall, the vertical housing prototype provides a practical and scalable solution to the affordable housing challenge in Lagos, as it improves land efficiency, increases housing supply, and supports better urban planning.

PROTOTYPE - STORYBOARDS

VERTICAL & MULTI-STOREY AFFORDABLE HOUSING IN LAGOS

High Land Costs in Lagos

Land is Expensive & Limited.

Building Upwards

Affordable Housing Units

Studio

1 Bedroom

2 Bedroom

Different Apartment Types

Ground Level Facilities

Middle Floor Living

Upper Floor & Water Tanks

High-Density Affordable Community

- ✓ Efficient Land Use
- ✓ Large Housing Capacity
- ✓ Organized Community Living

This housing development will include 10-15 storey building with 100-120 apartments and multiple blocks.

The building is constructed upwards instead of outwards so that more housing units can be created on a limited piece of land.

It was inspired by 1004 Estate in Lagos. The building contains several high-rise residential blocks that accommodate many households.

PROTOTYPE - WIRE FRAME

This Housing Loan & Property Management prototype streamlines homeownership by combining property discovery with a simplified loan application. It features an Easy Payment Plans selector for comparing 5- to 10-year durations and a central dashboard to track specific units (e.g., Unit 600). The flow bridges the gap between choosing an apartment and securing flexible financing.

Feedback Capture Grid

LIKES QUESTION	1. It's a brilliant idea, if there is funding for it 2. A great ideas but relies heavily on non-profit fundings.	1. I wish the solution is more viable 2. I wish the solution caters for the zero-income earners as well	WISHES
	1. How will profit be made from it? 2. Who are these angel investors that will fund the project?	1. It is too humanitarian and unrealistic 2. No profit will be made from the project, it will be a loss.	IDEAS
