

Design Thinking Module 2: Introduction to Design Methodology

Semicolon Design Thinking Course

semicolon

Not for onward distribution or use outside of the Semicolon community

Learning Objectives

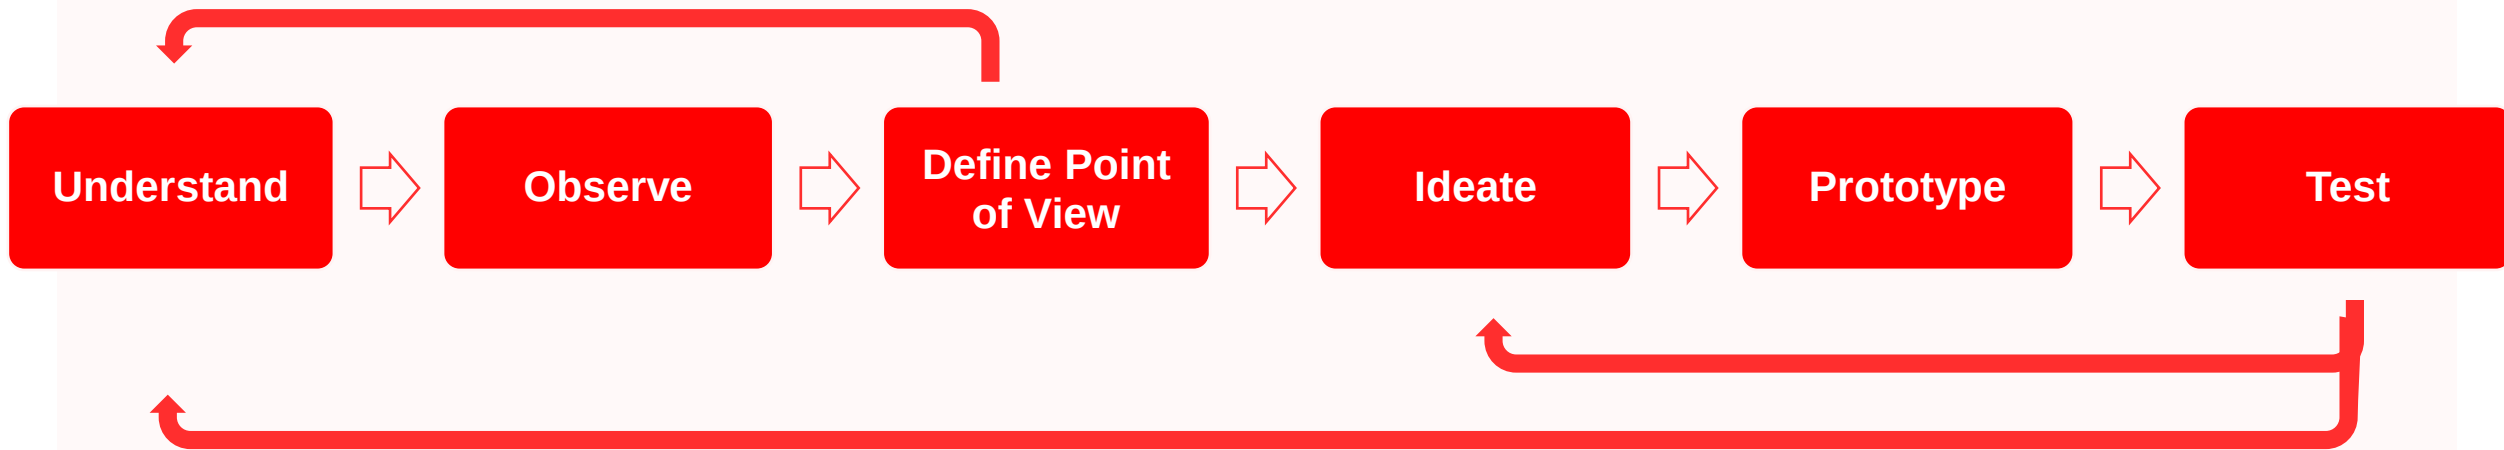

By the end of this module, you will:

- Understand the overall design process and its component phases
- Understand that there are different methods and tools that can be used at each phase of the design process

Brainstorm

What are some things we might do in the design process?

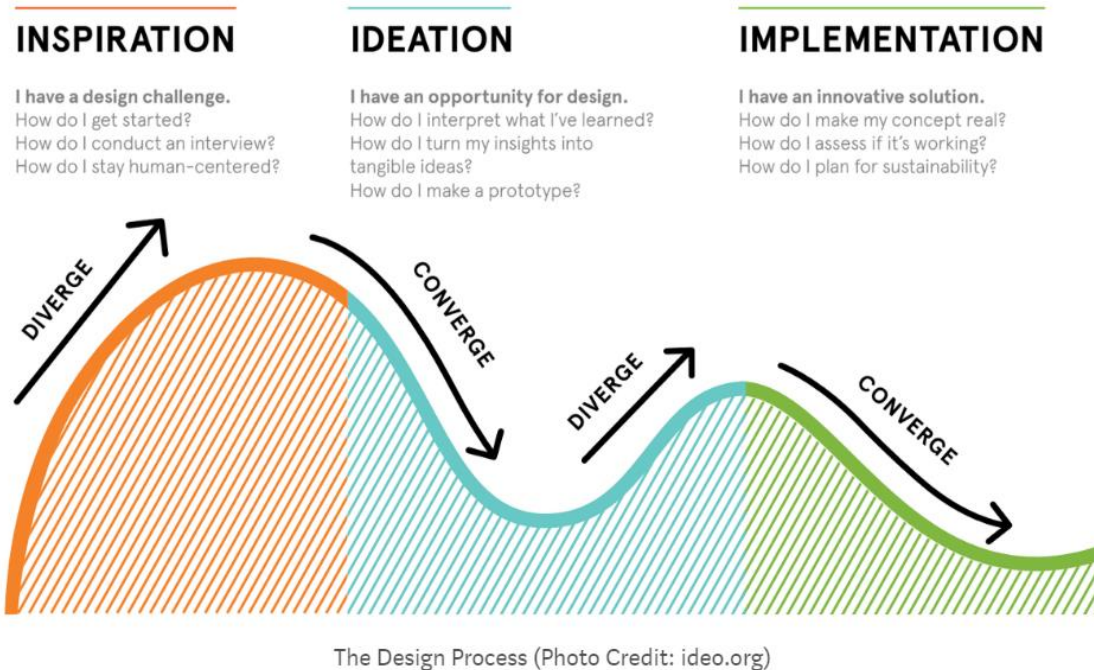

Overview of the Design Thinking Process

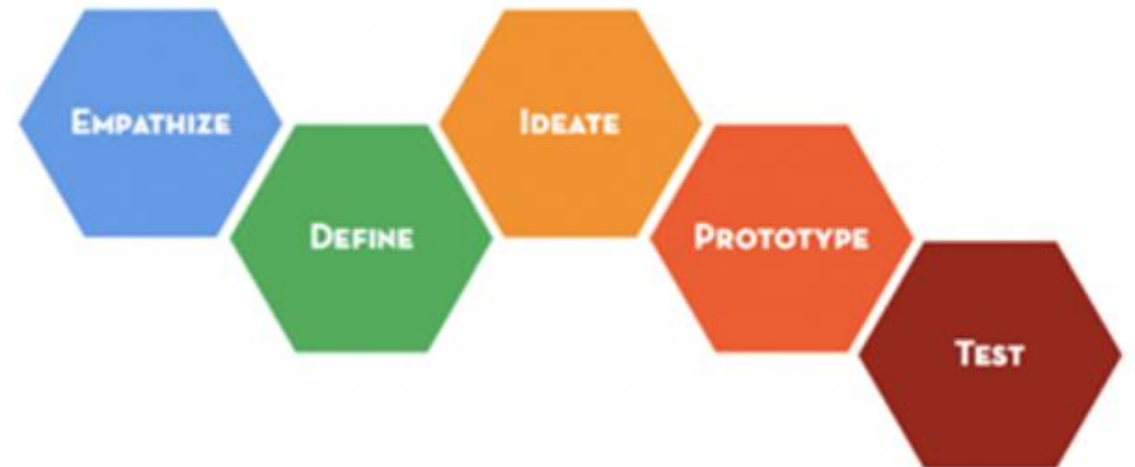

semicolon

Different organisations break down the Design Thinking process slightly differently, but the general approach is the same

IDEO

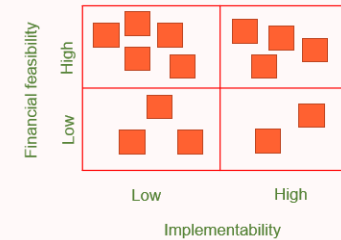

Stanford Design School (d.school)

semicolon

We will build your design toolkit

Understand

Observe

Define Point of View

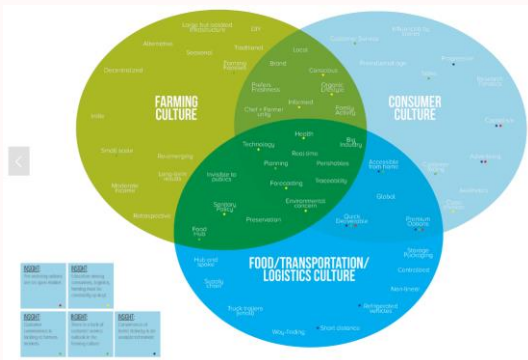

Ideate

Prototype

Test

We met _____

We were surprised to notice _____

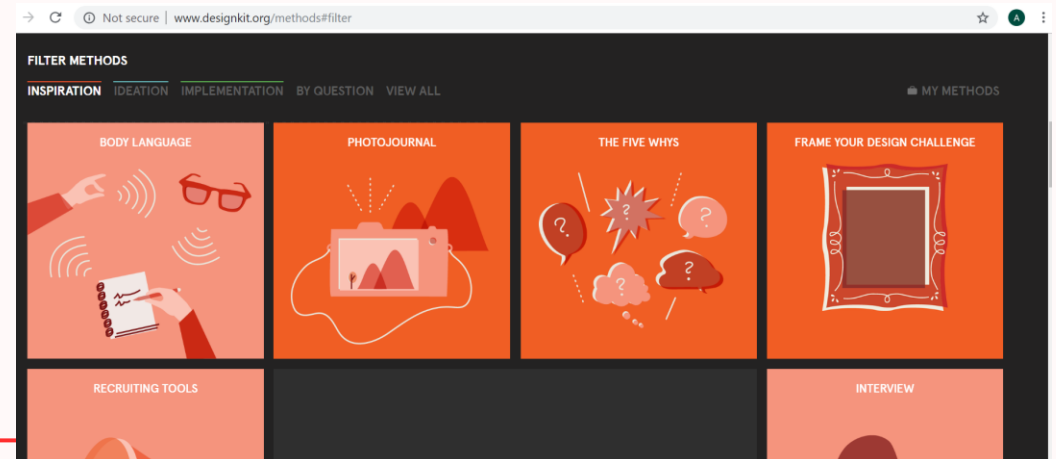

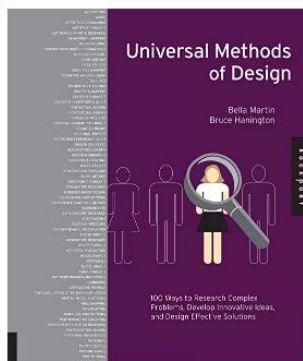

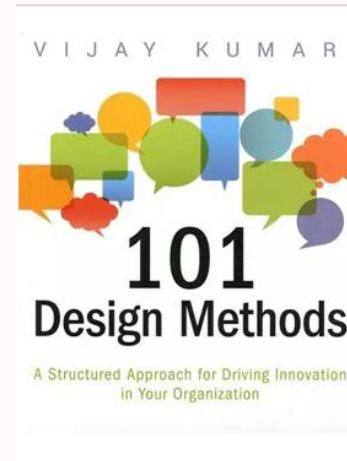

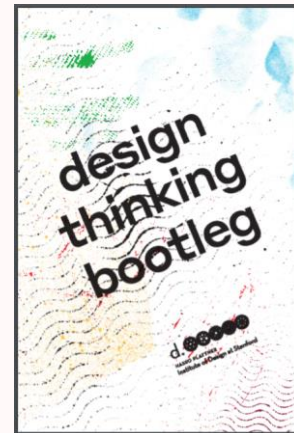

We wonder if this means _____

It would be game-changing to _____

semicolon

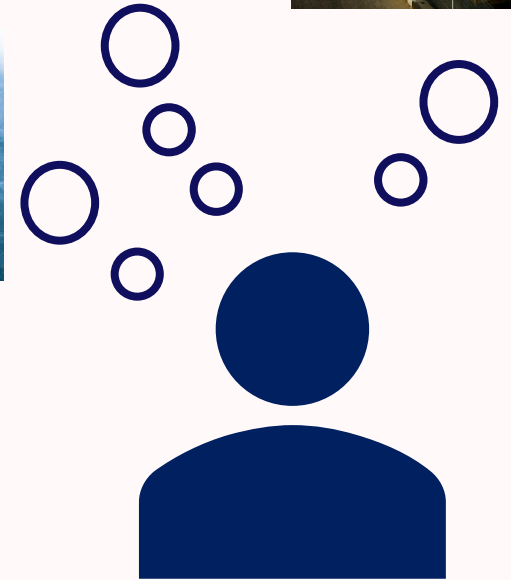

We will introduce you to different types of design thinking resources

semicolon

Phase 1: Understand

- Frame the design challenge
- Research and reflect on the overall context
- Review assumptions

semicolon

Phase 2: Observe

- Engage with the “humans” at the centre of the design process
- Capture insight about those people, through interviews, immersion, etc.
- Build **empathy**

Phase 3: Define Point of View

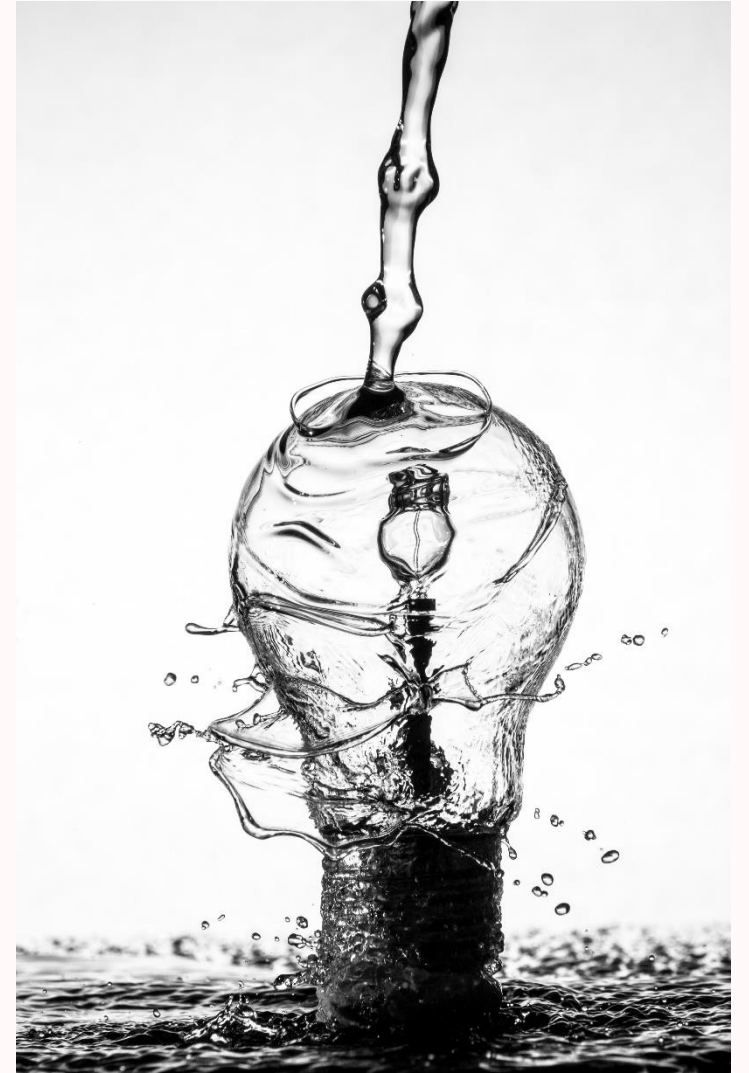

- Analyse information collected
- Synthesise this information to develop insights
- Develop a clear problem statement

semicolon

Phase 4: Ideate

- Generate innovative ideas to address the problem statement
- Start with a wide range of innovative ideas, then evaluate and select

Phase 5: Prototype

- Create a tangible artefact that can be used to test and refine ideas

*“If a picture is worth a thousand words,
a prototype is worth a thousand
pictures”*

- Stanford Design School

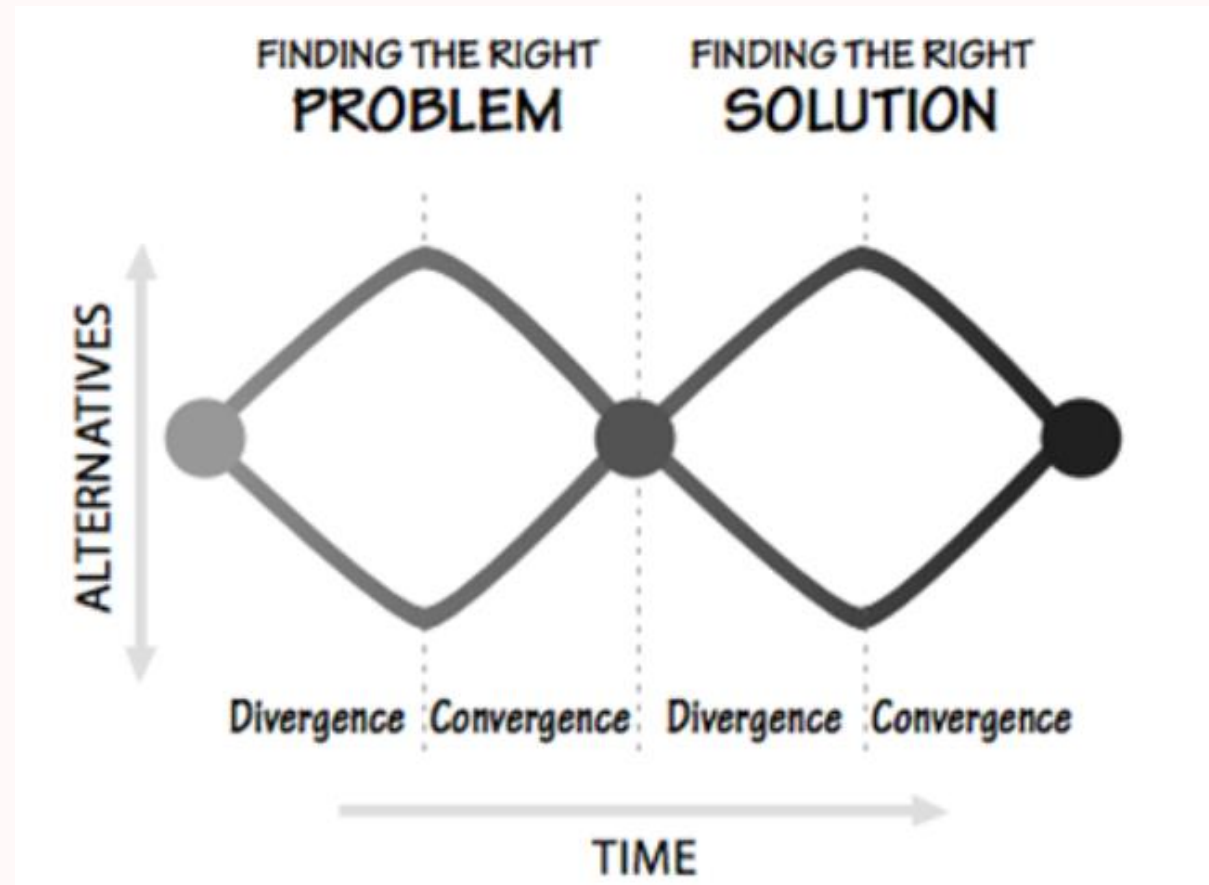

Phase 6: Test

- Through a planned testing process, discover what works, what doesn't, and capture actionable recommendations

Diverging and Converging

semicolon

Key Learning Points

- The Design Thinking process can be broken down into phases. In each of these phases we can use a variety of methods.
- Different schools/organizations will break down the phases in different ways, but the same general approach is followed
- The Design Thinking process is iterative – project teams may run through all of the design thinking phases multiple times over the course of a project, as they test, learn, and adjust their approaches
- In Design Thinking, we use divergent thinking – expanding and exploring more ideas – as well as convergent thinking, synthesizing information and refining to identify specific problems and solutions

semicolon
